# 1 INTRODUCTION

## 1.1 BACKGROUND

- 1.1.1 WSP | Parsons Brinckerhoff has been commissioned by Calderdale Metropolitan Borough Council (CMBC) under the Metro Framework to update and extend the existing Calderdale Strategic Transport Model (CSTM) to represent the current 2014 travel patterns and highway network conditions, in order to enable assessment of proposed developments and infrastructure schemes, and more specifically test the implications of delivery of CMBC schemes identified as part of the West Yorkshire plus Transport Fund (WY+TF).
- 1.1.2 A SATURN strategic model of the Calderdale area covering Halifax town and the adjacent centres was developed by Mouchel in 2008 and further expanded in 2009. The CSTM represented travel patterns that occurred across the key road network within the Borough, during a typical 2009 weekday. The model was developed to assess development options associated with Calderdale's Local Development Framework (LDF) and also to enable testing of a series of highway improvements options.
- 1.1.3 The 2009 CSTM inherited model formed the basis of the update to 2014 travel patterns and highway network conditions taking account of all significant highway network changes and developments since the model's previous update.
- 1.1.4 The 2014 model has been developed in accordance with the Department for Transport (DfT) web based Transport Analysis Guidance (WebTAG) on <http://www.dft.gov.uk/webtag> along with the WebTAG 2 'Guidance for the Technical Project Manager.' These provide detailed guidance on the appraisal of transport projects and wider advice on scoping and carrying out transport studies. The guidance is a requirement for all projects/studies that require government approval.

## 1.2 REPORT PURPOSE AND STRUCTURE

- 1.2.1 This report is a Local Model Validation Report (LMVR) for the 2014 base year SATURN modelling. This report details the development, calibration and validation of the traffic model to 2014 observed traffic conditions.
- 1.2.2 The structure and content of this LMVR is based on guidance contained in WebTAG 'Guidance for the Technical Project Manager' Appendix D (January 2014).
- 1.2.3 The structure of this report is as follows:
- Section 2: Model Overview
  - Section 3: Survey Data Collection & Analysis
  - Section 4: Network Development
  - Section 5: Matrix Development
  - Section 6: Assignment Calibration & Validation
  - Section 7: Summary

# 2 MODEL OVERVIEW

## 2.1 INTRODUCTION

2.1.1 This section of the report details the specification of the CSTM. Detailed information regarding the construction of the network and matrices can be found in Section 4 and Section 5 of this report.

## 2.2 MODELLING SOFTWARE VERSION

2.2.1 SATURN (Simulation and Assignment of Traffic in Urban Road Networks) Version 11.3.07K was used for the updating of the CSTM. SATURN is a recognised industry-standard transport modelling tool providing:

- A modelling and assessment platform supported by CMBC, WYCA and the Highways Agency (HA);
- WebTAG compliance in terms of structure and model ‘convergence’ and output statistics essential for scheme appraisal and the determination of robustness in decision-making and scheme design; and
- A comprehensive and efficient data input and analysis capability

## 2.3 BASE YEAR

2.3.1 The updated base year of the CSTM is 2014. This is determined by the Road Side Interview traffic data commissioned for this study which was collected in June 2014 and supplemented by additional junction and link surveys from April and October 2014.

## 2.4 TIME PERIODS

2.4.1 The model was developed for the following time periods outlined below. The inter peak hour model is taken as an average hour between the inter peak period of 10:00 to 16:00.

- Average weekday AM Peak Hour: 08:00 - 09:00
- Average weekday Inter Peak Hour: 10:00 - 16:00
- Average weekday PM Peak Hour: 17:00 - 18:00

## 2.5 USER CLASSES

2.5.1 In the CSTM, as in most conventional highway assignment models, routeing of trips between origin and destination zones is dictated by weightings applied to time and distance. The weightings are based on central government research into the values of time and the perceived costs of the travel of road users.

2.5.2 SATURN permits ‘multiple user class’ assignment in which vehicles and users (identified by vehicle type and journey purpose as below) may be assigned onto the highway network. In CSTM 2014 the assignment model comprises six user classes as follows:

- UC1: Cars on employers’ business
- UC2: Cars commuting
- UC3: Cars ‘other trips’

- UC4: Light Goods Vehicles (LGV)
- UC5: Heavy Goods Vehicles (OGV 1)
- UC6: Heavy Goods Vehicles (OGV 2)

**2.5.3** Public Service Vehicles (PSVs) i.e. buses have not been included in the model as a distinct user class. Instead they have been represented on the network as fixed flows along a defined route with a peak hour frequency relevant to the respective peak hour modelled. Defining buses in this manner means their impact in terms of congestion and subsequently journey times around the model is captured and their routing realistic in terms of current bus provision when traffic surveys were undertaken.

## 2.6 GENERALISED COST PARAMETERS

**2.6.1** Generalised costs were calculated using values of time, GDP growth rates, purpose splits, and vehicle operating costs recommended by the DfT for use in economic appraisals of transport projects in England, as presented in the WebTAG Databook (November 2014).

**2.6.2** The values calculated for use in the base year models are shown in Table 2.1 and Table 2.2. Table 2.1 outlines the Pence per Minute (PPM) values by peak period and vehicle class, whilst Table 2.2 shows this in terms of Pence per Kilometre (PPK).

**Table 2.1 - Generalised Cost Parameters, Pence per Minute (PPM)**

PEAK	CAR EMPLOYERS BUSINESS	CAR COMMUTING	CAR OTHER	LGV	OGV 1	OGV 2
AM	54.55	13.52	17.25	24.19	24.87	24.87
IP	53.29	13.42	17.93	24.19	24.87	24.87
PM	52.44	13.23	18.45	24.19	24.87	24.87

**Table 2.2 - Generalised Cost Parameters, Pence per Kilometre (PPK)**

PEAK	CAR EMPLOYERS BUSINESS	CAR COMMUTING	CAR OTHER	LGV	OGV 1	OGV 2
AM	13.74	10.03	10.03	10.44	22.97	48.32
IP	13.74	10.03	10.03	10.44	22.97	48.32
PM	13.74	10.03	10.03	10.44	22.97	48.32

**2.6.3** The assignment technique that has been used is Wardrop Equilibrium Assignment which is the default assignment procedure within SATURN. Wardrop's Principle of traffic equilibrium states that:

*"Traffic arranges itself on congested networks such that the cost of travel on all routes used between each O-D pair is equal to the minimum cost of travel and all unused routes have equal or greater cost."*

## 2.7 PASSENGER CAR UNITS

2.7.1 Standard factors to convert each vehicle type in to passenger car units (pcu) have been taken from TAG Unit M3.1 Highway Assignment Modelling Appendix D - Section D7 Conversion to Passenger Car Units (January 2014). These are:

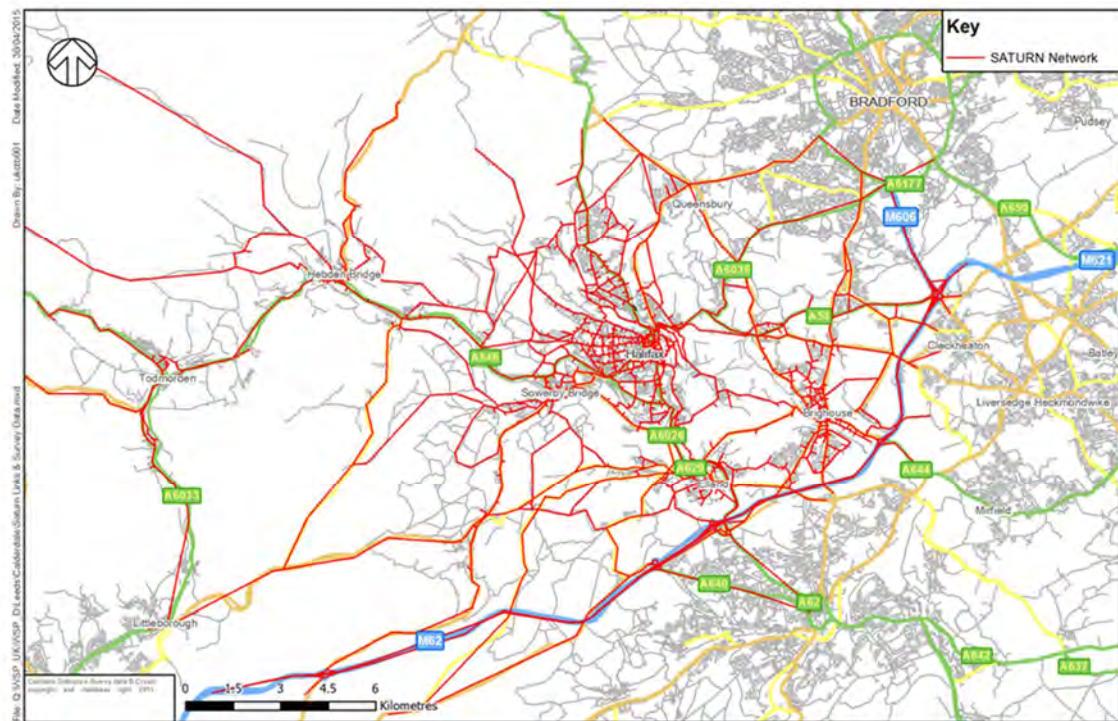

→ Car:	1.0
→ Light Goods Vehicle:	1.0
→ HGV on Motorway and all-purpose dual carriageway:	2.5
→ HGV on other road types:	2.0

2.7.2 In an assignment model, it is not possible to allocate different PCU factors to a particular user class according to link type. Guidance is not given on this aspect in WebTAG, so a default pcu factor of 2.0 has been applied to all HGVs, since the majority of links within the model are not motorway or all-purpose dual carriageway.

## 2.8 TRANSPORT MODEL AREA

- 2.8.1 The CSTM contains a total of 2,297 nodes and 5,519 links. The model covers the Calderdale District representing all key highway links and junctions with appropriate minor road network detail in the key towns of the district.
- 2.8.2 The coverage of the model includes the M62 with the connections from Junction 22 and the A672, Junction 23 and the A640, Junction 24 and the A629, Junction 25 and the A644, and Junction 26 and the A58. All major routes through the district to the key towns are represented including the A646 to Hebden Bridge and Todmorden, A629 to Illingworth, A6036 to Shelf, A644 and A641 to Brighouse.
- 2.8.3 The model includes urbanised areas such as Halifax town centre, Elland and Brighouse, in considerable detail with the local roads included within the assignment as well as major strategic roads.
- 2.8.4 The transport model area and links included within the model are shown in Figure 2.1 below.

**Figure 2.1 - Extent of Transport Model Area**

## 2.9 ZONING SYSTEM

- 2.9.1 The zone system of the CSTM has been designed such that it is sufficiently detailed to credibly represent trip loading points from different land uses onto the transport network. In total there are 278 zones in the CSTM. Plans of the zone system are included in Appendix B.
- 2.9.2 Within Halifax, additional zones were created by splitting the original CSTM zones during the validation process in order to provide sufficient detail to accurately represent observed traffic conditions, as shown in figure B-1.
- 2.9.3 South of the M62, the zone loading was adjusted to create single zones loading onto each entry point into the network. This was essential, as each corridor as a traffic count, with many of them also hosting RSI sites, and the only way to validate these counts at this level of detail is to provide a separate zone. Further accuracy in this area can be obtained by extending the detailed simulation area into Kirklees, which is the aim of a future update to the model.
- 2.9.4 Further east along the M62 up to Junction 26, additional detail was added with seven zones introduced at specific loading points, rather than the single zone (33) used in the original model. The number of external zones at the eastern and western fringes of the model was substantially reduced as the original model had multiple zones loading onto the same point at edges of the network. The revised CSTM zone structure involves a single zone (813) loading onto the western end of the M62 and another zone (827) loading onto the eastern end of the M62 as shown in figure B-3.
- 2.9.5 Zone loading was amended in many instances within the main simulation network by ensuring zones loading onto a single 'spigot' access link representing an existing road, logical in relation to the area covered by the model zone. The original model was found to contain a number of zones loading across multiple spigots and across links. This arrangement did not allow for counts to be interpreted or matched in a logical way, and also caused major problems with model convergence.

# 3 SURVEY DATA AND COLLECTION & ANALYSIS

## 3.1 INTRODUCTION

- 3.1.1 To produce a robust and ‘fit for purpose’ model, a suitable data collection exercise was undertaken by SkyHigh-CountOnUs in June 2014, under the instruction of CMBC, including Road Side Interviews (RSIs), supplemented by additional junction and link data collected in April and October 2014 as part of parallel studies on the A629 corridor.
- 3.1.2 This section provides a summary of the survey data obtained and how it was processed in order for it to be used to create the base year SATURN model. The following data was collected for model development, or was already available via existing sources:
- 19 Road Side Interviews (RSIs)
  - 10 ATC sites collected by SkyHigh-CountOnUs;
  - 7 Automatic Traffic Counts (ATC) sites collected by NDC;
  - 10 Permanent ATC Sites from <http://www.c2traffic.co.uk>;
  - 133 Automatic Traffic Counts (ATC) sites from <http://www.c2traffic.co.uk>;
  - 9 Highways Agency TRADS Count Sites
  - 16 Manual Classified Counts (MCC) sites collected by NDC in April;
  - 14 Manual Classified Counts (MCC) sites collected by NDC in October; and
  - 1 ANPR site collected by SkyHigh-CountOnUs.

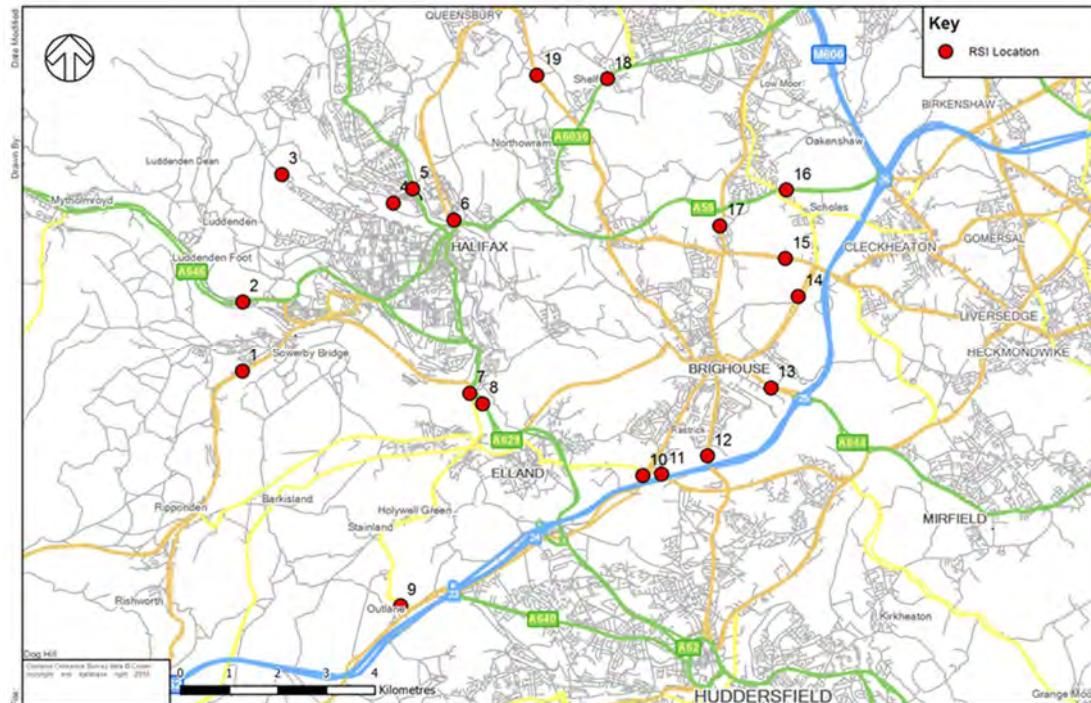

## 3.2 ROADSIDE INTERVIEW DATA

3.2.1 Table 3.1 details the location of the 19 RSIs.

**Table 3.1 - RSI Locations**

SITE ID	DESCRIPTION	DATE	INTERVIEW DIRECTION
1	A58 Rochdale Road	17/06/2014	Eastbound
2	A646 Burnley road	10/06/2014	Eastbound
3	Moor End Road	10/06/2014	North-Westbound
4	Shroggs Road	10/06/2014	Southbound
5	Ovenden Road	18/06/2014	Southbound
6	Haley Hill	18/06/2014	South-Eastbound
7	Stainland Road	18/06/2014	Northbound
8	A629 Elland Wood Bottom	11/06/2014	Southbound
9	New Road	11/06/2014	Southbound
10	New Hey Road	24/06/2014	North-Eastbound
11	Clough Lane	24/06/2014	Eastbound
12	A641 Huddersfield Road	17/06/2014	Southbound
13	A644 Wakefield Road	17/06/2014	Eastbound
14	Walton Lane	17/06/2014	Northbound
15	Birkby Lane	19/06/2014	Eastbound
16	A58 Whitehall Road	19/06/2014	Eastbound
17	Bradford Road	12/06/2014	Northbound
18	Wade House Road	12/06/2014	North-Eastbound
19	A644 Brighouse & Denholme Gate Road	12/06/2014	Southbound

**Figure 3.1 - RSI Locations**

**3.2.2** Information on the following was obtained for each respondent:

- Vehicle type
- Number of occupants
- Origin postcode for trip
- Reason for being at origin
- Destination postcode for trip
- Reason for going to destination

**3.2.3** RSIs were conducted between 07:00 and 19:00 on the respective survey date. Associated MCCs were also carried out over the same time period, on the same day as the relevant RSI in both directions, in order to gain a full understanding of the make-up and volume of traffic at each location.

**3.2.4** Existing ATC information available from CMBC via <http://www.c2traffic.co.uk>, for temporary and permanent sites at comparable locations, was used to expand the MCC counts at the RSI sites in order to provide a more robust long-term average traffic count unaffected by disruptions associated with the RSIs themselves. Where no ATCs were available, the MCC associated with the RSI was used to expand the data.

## 3.2.5

Table 3.2 shows the number of logical face-to-face interviews in the interview direction and the proportion of the total traffic these represent. Logic checks were carried out, with data excluded if any key field related to the RSI record was incomplete. Appendix C contains origin and destination postcode plots for each RSI site. In certain instances, there are records which appear to be the wrong side of the RSI based on whether they are an origin or destination and the interview direction. Examination of these individual records does not show these interviews to be illogical definitively - they could be part of a linked trip or a logical journey for the specific respondent involved. It was decided to not exclude such records to ensure the data used was not biased by presumptions of travel patterns through the RSI sites.

**Table 3.2 - RSI Interviews & Sample Size**

SITE ID	DESCRIPTION	INTERVIEW DIRECTION	LOGICAL JOURNEYS	INCOMPLETE / ILLLOGICAL JOURNEYS	MCC INTERVIEW DIRECTION	LOGICAL SAMPLE RATE	MCC NON-INTERVIEW DIRECTION
1	A58 Rochdale Road between Lower Brockwell Lane & Mill House Lane	EB	694	29	3996	17%	4426

19	A644 Brighouse & Denholme Gate Road between Shaw Lane and Bowl Shaw Lane	SB	1009	113	4335	23%	4881

3.2.6 Typical sample rates for RSIs generally lie in the range of 10-20%. The samples achieved here are mostly within that range, with some sites being considerably better.

### 3.3 ATC DATA

3.3.1 Temporary ATCs were laid down for the purposes of this study to supplement existing ATC information available from CMBC via <http://www.c2traffic.co.uk>, for permanent and temporary sites. The existing data available from the above website, supplemented by project specific data collected, provides sufficient coverage to robustly develop the base model.

3.3.2 Table 3.3 below lists the Temporary ATCs commissioned for this study and parallel CMBC studies:

### 3.3.3

Figure 3.2 shows the location of the project specific ATC sites.

**Figure 3.2 - Project Specific Temporary ATC Sites**

### 3.3.4

The classified surveys are based on vehicle type and axle length outlined in Table 3.4. The vehicle types were then re-classified into Car, LGV, OGV1 and OGV2 in order to build matrices for the CSTM.

**Table 3.4 - Vehicle Classification**

VEHICLE TYPE	CLASS	DATE COLLECTED	CSTM CLASSIFICATION
Very short Bicycle or Motorcycle	MC	1	d(1)<1.7 and axles=2
Short Sedan, Wagon, 4WD, Utility, Light Van	SV	2	d(1)>1.7m d(1)<=3.2m. and axles=2
Short-Towing Trailer, Caravan, Boat, etc.	SVT	3	Groups=3,d(1)>2.1m d(1)<=3.2m. d(2)>=2.1m and axles=3,4,5
Two Axle Truck or Bus	TB2	4	d(1)>3.2m and axles=2
Three Axle Truck or Bus	TB3	5	Axes=3 and groups=2
Four Axle Truck	T4	6	d(1)>3.2m. axles=3 and groups=3
Three Axle Articulated Three axle articulated vehicle or rigid vehicle and trailer	ART3	7	d(1)>3.2m. axles=3 and groups=3
Four Axle Articulated Four axle articulated vehicle or rigid vehicle and trailer	ART4	8	d(2)<2.1m or d(1)<2.1m or d(1)>3.2m axles=4 and groups>2
Five Axle Articulated Five axle articulated vehicle or rigid vehicle and trailer	ART5	9	d(2)<2.1m or d(1)<2.1m or d(1)>3.2m axles=5 and groups>2
Six Axle Articulated Six axle articulated vehicle or rigid vehicle and trailer	ART6	10	Axes=6 and groups>2 or axles>6 and groups=3
B-Double or Heavy truck and trailer	BD	11	groups=4 & axles>6
Double or triple road train or Heavy truck and two (or more) trailers	DRT	12	groups>=5 & axles>6

### 3.3.5

Table 3.5 below lists the Permanent ATCs situated in Calderdale, around Halifax:

**Table 3.5 - Permanent ATC Sites**

## 3.3.7

Figure 3.3 shows the location of the permanent ATC sites that are located in Calderdale.

**Figure 3.3 - Permanent ATC Sites**

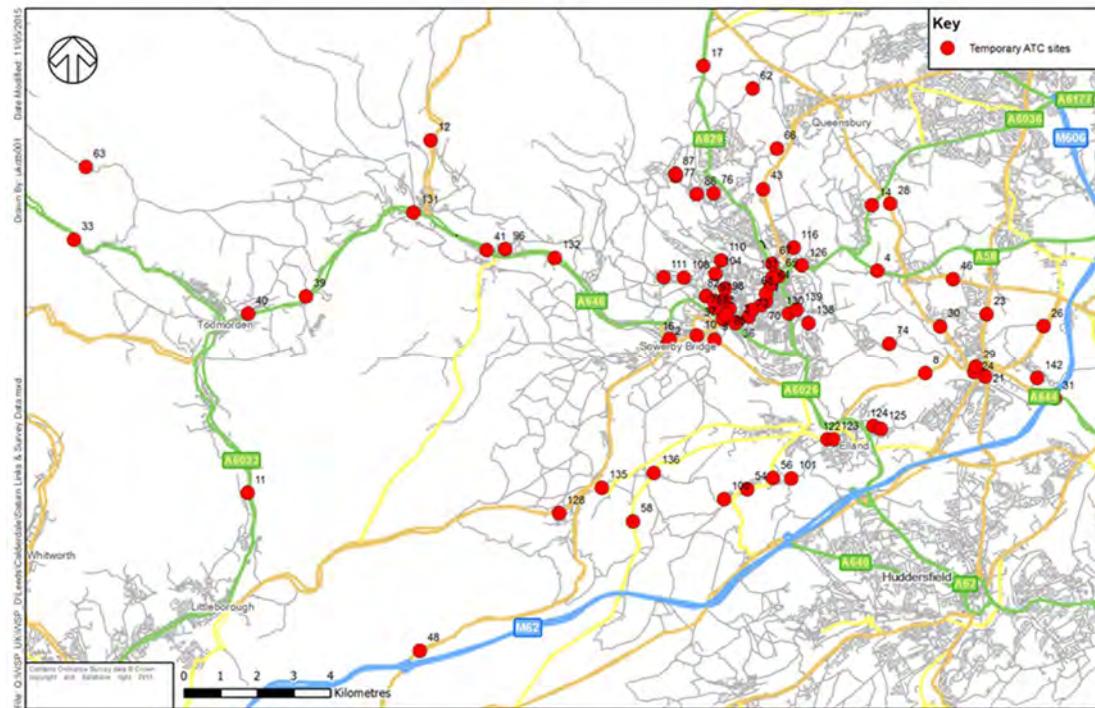

## 3.3.8

Appendix D lists the Temporary ATCs available via CMBC's online data storage system. 79 of the 133 sites have been used for validation and calibration. The remainder of the sites were considered but disused due to location and/or date collected where it was considered to be in the same place as another site with a more suitable date range:

## 3.3.9

Figure 3.4 shows the location of the temporary ATC sites laid by CMBC.

**Figure 3.4 - Temporary CMBC ATC sites**

### 3.3.10

The volumetric counts were split into Car, LGV, OGV1 and OGV2 based on the proportions of these vehicle types in the 19 MCC RSI counts. The proportions by peak hour are shown in Table 3.6 with the inter peak hour representing an average hour between 10:00 and 16:00. Overall model calibration and validation is controlled to total vehicles, so although the vehicle split is useful to determine the assignment, it is not critical to overall performance.

**Table 3.6 - Permanent ATC Vehicle Splits**

CLASS	AM PEAK (08:00-09:00)	INTER PEAK (10:00-16:00)	PM PEAK (17:00-18:00)
Car	87.47%	82.59%	91.01%
LGV	10.70%	14.56%	8.28%
OGV1	1.23%	1.91%	0.48%
OGV2	0.60%	0.93%	0.23%

**Table 3.7 - HGV Vehicle Splits**

CLASS	OGV 1	OGV 2
HGV	67.23%	32.77%

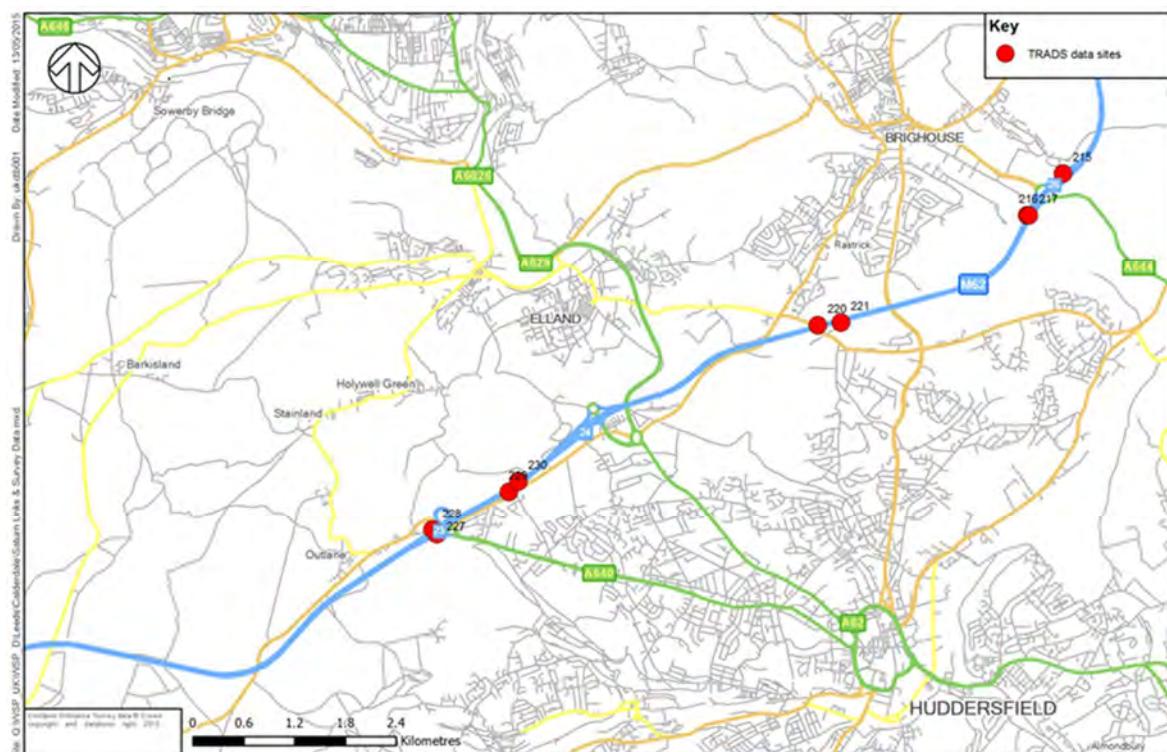

### 3.4 TRADS DATA

- 3.4.1 TRADS counts were downloaded from the HATRIS website (<https://www.hatris.co.uk>) for various locations along the M62 between Junction 23 and Junction 26, included within the SATURN simulation network. Junction 22 has not been included, as it lies at the edge of the modelled area, so there is insufficient detail in the model to calibrate flows at this junction.
- 3.4.2 Table 3.8 below lists the sites and provides descriptions. All of the data is averaged from relevant non-school holiday months in 2014. Figure 3.5 shows the location of TRADS sites

**Table 3.8 - Selected TRADS Sites**

REF	SITE ID	DESCRIPTION	DIRECTION	CLASSIFICATION	DATE

**Figure 3.5 - TRADS sites**

### 3.5 MCC DATA

3.5.1 Data collection commissioned as part of a parallel CMBC project included 16 turning count surveys at junctions in the south Halifax area, focused around the A629 corridor. Data was collected on Tuesday 8 April 2014. Table 3.9 below lists the sites and provides descriptions.

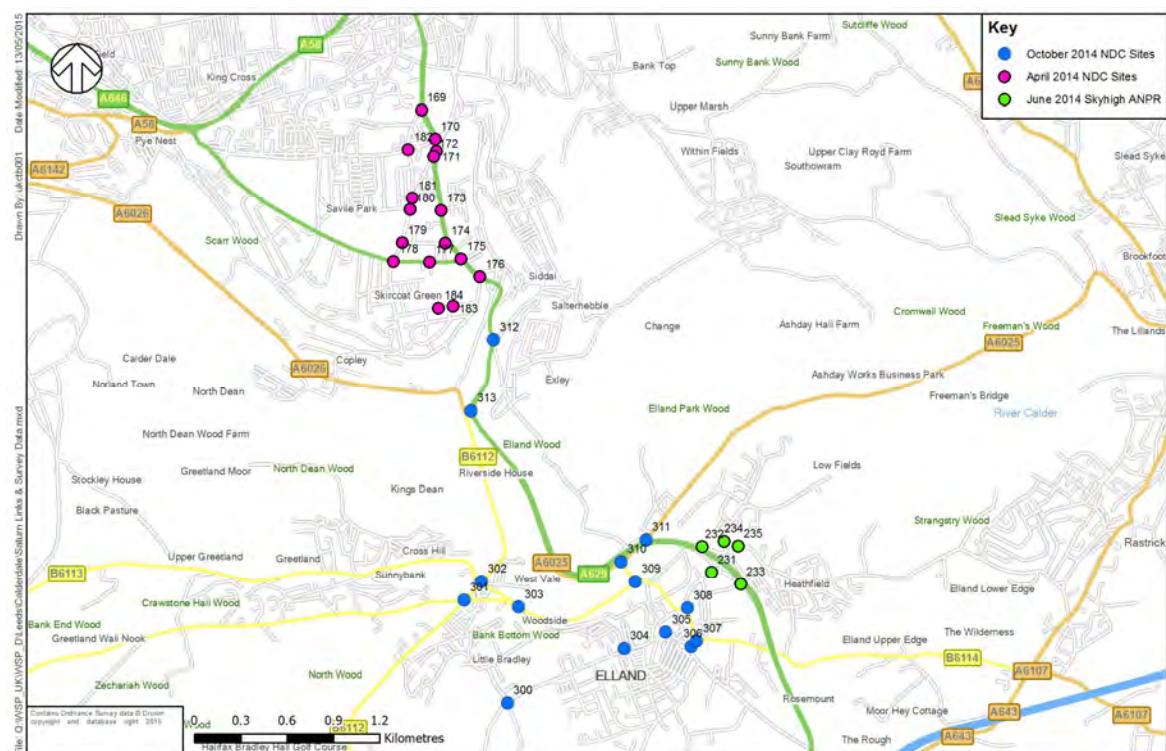

3.5.2 The MCC data in table 3.9 was not used for turning count validation. Link flows were derived from the MCC arm totals and used during model validation.

**Table 3.9 - MCC Sites**

Figure 3.6 - MCC and ANPR surveys

**Figure 3.7 - MCC surveys south of Halifax**

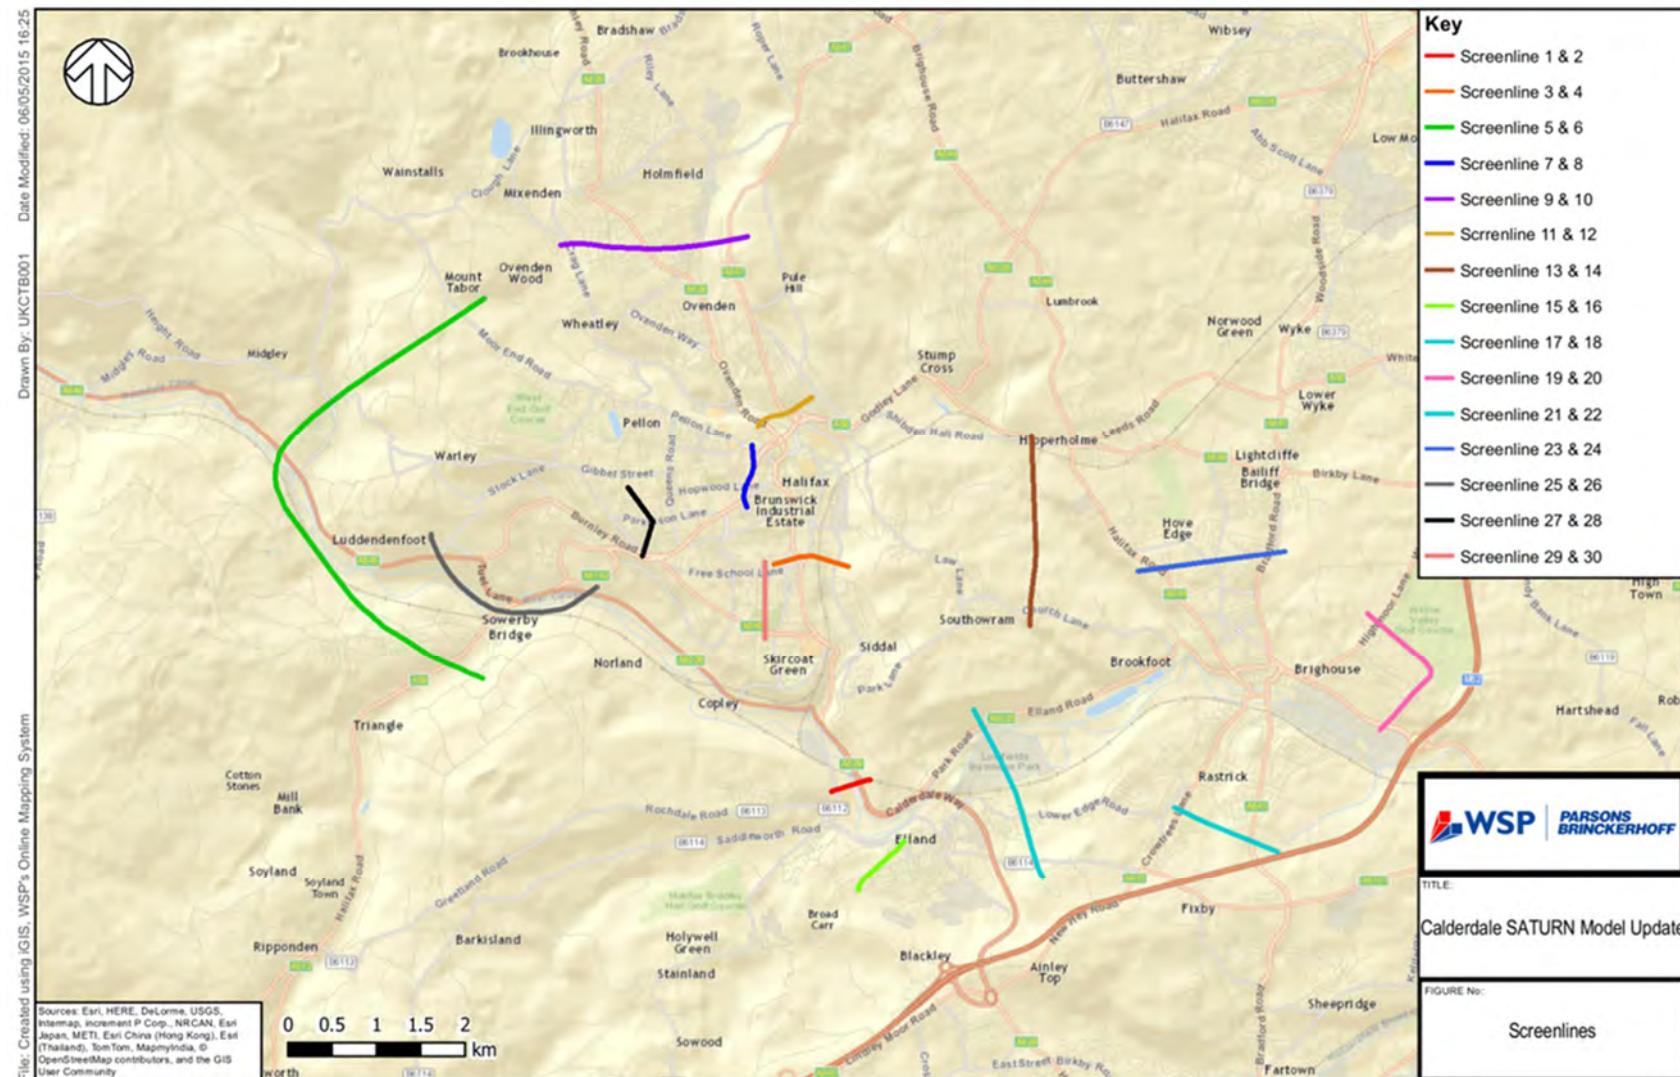

## 3.6 ANPR DATA

3.6.1 SkyHigh-CountOnUs were commissioned to collect ANPR data for the Elland Riorges Link dumbbell roundabout under the A629 near Lowfields Business Park. The data was collected on Thursday 12 June 2014 between 07:00 – 19:00. This is shown above in figure 3.6

## 3.7 SCREENLINES

3.7.1 Screenlines were defined across the CSTM detailed in figure 3.8 and Table 3.10

Figure 3.8 - Screenline Locations

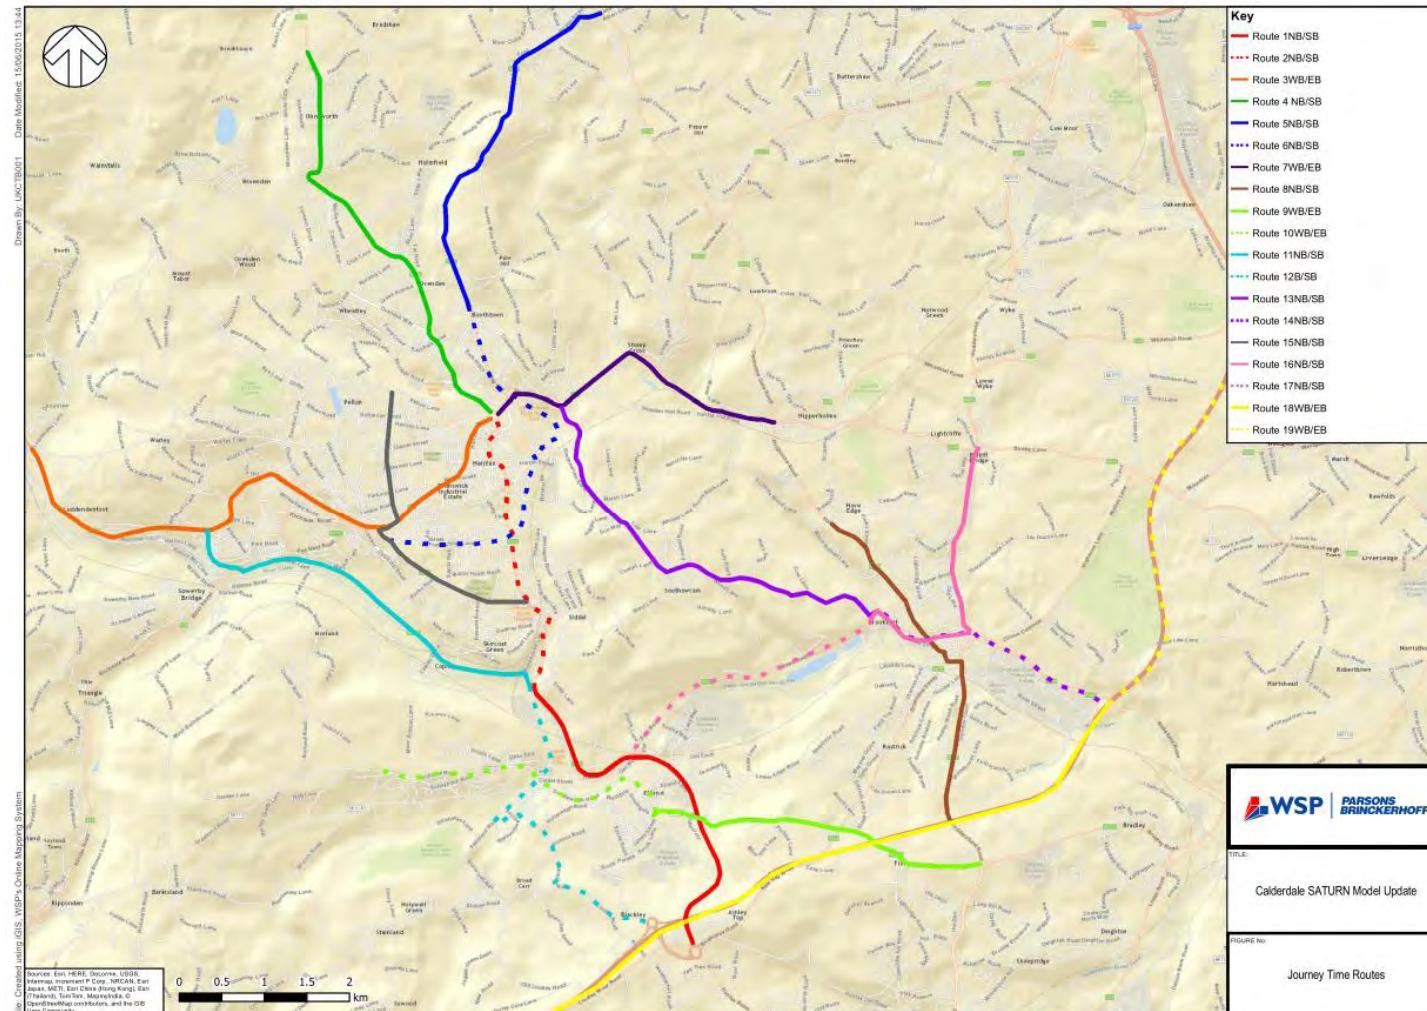

**Table 3.10 - Screenline description**

SCREENLINE ID	DIRECTION	DESCRIPTION OF ROADS INTERSECTED
1	Northbound	A629 & Stainland road
2	Southbound	A629 & Stainland Road
3	Northbound	Heath Road, A629, Huddersfield Road & Shaw Lane
4	Southbound	Heath Road, A629, Huddersfield Road & Shaw Lane
5	Eastbound	Moor End road, Luddenden Lane, A646 & A58

## 3.8 JOURNEY TIME DATA

- 3.8.1 Journey time data was obtained from TrafficMaster data. TrafficMaster is an online tool which calculates average journey time based on real-life traffic delays and movements. The journey time route observations were taken for June 2014 and were provided for 38 routes. These routes provided sufficient coverage of the network with the focus being around Halifax town centre. The journey time data was provided for average node to node journey times for all peak periods.
- 3.8.2 These routes are shown in figure 3.9 and described in table 3.11 covering major strategic movements and key route paths in the modelled area.

**Figure 3.9 - Journey Time Routes**

**Table 3.11 - Journey time route description**

ROUTE ID	DESCRIPTION	DIRECTION	DISTANCE (KM)

# 4 NETWORK DEVELOPMENT

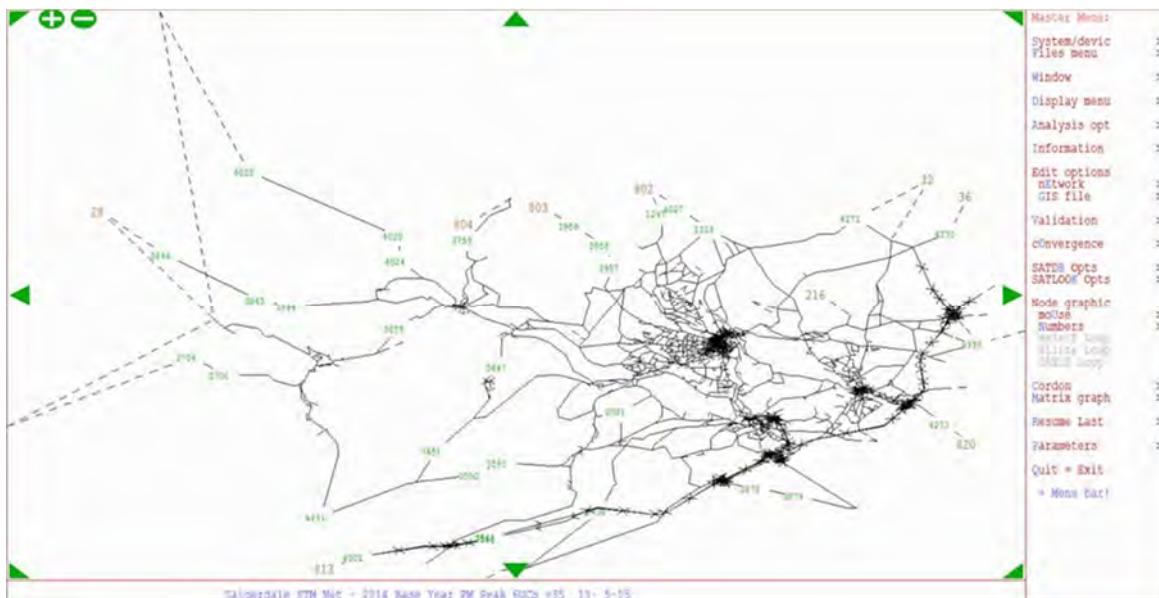

## 4.1 INTRODUCTION

4.1.1 The network covers all key highway links and junctions extending through the Calderdale district. All key network improvements were done in the simulation network, however a buffer network was provided around the edge of Calderdale that connects to external district locations.

## 4.2 NETWORK BUILDING

4.2.1 The inherited model and details of the previous update can be found in the previous consultants LMVR written by Mouchel in 2010. The model predominantly covers the Calderdale Metropolitan Borough area, with a small amount of the network extending into neighbouring districts/boroughs the extent of the model is shown in Figure 4.1 below.

**Figure 4.1 - Extent of CSTM 2014 Modelled Area**

4.2.2 The network has been updated in SATURN with ArcGIS, site visits and aerial photography used for assistance. Checks based on internal GIS systems and GIS itself have been carried out for the following:

- Link Length
- Speed/flow relationship
- Link Type and Saturation flows
- Link Capacity
- One/Two way operation
- Number of effective lanes\*
- Length and position of effective flares\*\*
- Any observed turn delays/penalties

- Location of public transport routes
- Access points
- Junction changes and type

\*Number of effective lanes is the amount of lanes that have an effect on traffic flow

\*\*Effective flares are the amount of flares that have an effect on traffic flow at a junction.

# 5 MATRIX DEVELOPMENT

## 5.1 MATRIX BUILDING INTRODUCTION

- 5.1.1 This section outlines the methodology used to build the AM peak, inter peak and PM peak matrices.
- 5.1.2 The following user classes and pcu factors were used during the matrix construction process:
- UC1: Car: Employer's Business – 1.0
  - UC2: Car: Commuting – 1.0
  - UC3: Car: Other – 1.0
  - UC4: LGV – 1.0
  - UC5: OGV1 – 2.0
  - UC6: OGV2 – 2.0

## 5.2 RSI MATRIX

- 5.2.1 RSI data includes information on:
- The time at which the vehicle passed through the RSI site
  - Vehicle type
  - Vehicle occupancy
  - Purpose of a journey
  - Origin and destination address of a trip
- 5.2.2 The RSI data obtained was the primary source of data used to build the demand matrices and capture trips local to the study area. For each site and interview direction, vehicles surveyed were split into four vehicle types detailed below. Motorcycles were not included as they were not a designated user class within the model and do not generally contribute to congestion:
- Car / Taxi
  - LGV
  - OGV1
  - OGV2
- 5.2.3 The RSI origin-destination data was cleaned and assigned to their appropriate zone. The interview records have been divided by time period, purpose and vehicle type.

- 5.2.4 For the non-interview direction in the AM peak period (07:00-10:00), the car, taxi and LGV RSI records in the PM peak (16:00-19:00) were selected. This makes the assumption that the PM peak (16:00-19:00) interview direction records made the other leg of their journey between the respective origin and destination zones in the non-interview direction in the AM peak (07:00-10:00) and therefore the data was transposed. The transposed records were then scaled to match the non-interview AM peak count controlled by journey purpose and vehicle type. The equivalent process was applied in the PM peak (16:00-19:00), using transposed AM peak movements and scaled accordingly. In the interpeak (10:00-16:00), the transpose of the interpeak interview movements was used.
- 5.2.5 Trips within each peak period are generally considered to remain representative of trip behaviour within that period. For example, trips in the AM peak period (07:00-10:00) are mostly commuting trips, and the origin-destination patterns across the whole period are reflected in the patterns of the peak hour itself (08:00-09:00). To increase the sample rate car and LGV user interview data for 3 hours (07:00-10:00; 16:00-19:00) for the AM peak and PM period and 6 hours (10:00-16:00) for the inter peak was taken into account and factored to the count of the peak of one hour period being modelled. This makes best use of the RSI data and reduces the reliance on the existing matrix. Trips are not mixed between time periods for the Car and LGV user classes.
- 5.2.6 Because the number of observations was small, OGV1 and OGV2 trips were not split into peak periods, instead the entire RSI survey period (07:00-19:00) for these user classes were included in the respective peak matrix which was being built irrespective of the time the interview was recorded for this journey. This was done to limit the number of instances where no heavy vehicles were present in the creation of expansion factors.
- 5.2.7 Hourly expansion factors were then derived in order to expand the RSI matrix from representing a sample of the traffic to the total traffic flow. This was done by dividing the ATC volume by the total number of interviews for the relevant vehicle type. These expansion factors were then used against each individual RSI record to create a matrix which matched the ATC totals.

**Table 5.1 - RSI expansion factors by interview direction and vehicle type**

	PM peak	565	54	12	0	631	604	81	8	0	693

- 5.2.9 Some expansion factors are less than 1. This occurs primarily in the interpeak, where trips across the whole 6 hour interpeak period are factored to match the count for the single average interpeak hour. Small expansion factors in the AM and PM peaks occur as a result of factoring 3 hour peak period observations to a single peak hour count taken as an average from multiple ATC observations. This average may well be lower than the MCC undertaken on the particular survey day.
- 5.2.10 Each individual directional RSI matrix was assigned in isolation to the modelled network in order to check the routing, and origin-destination patterns appeared logical. These checks also assisted in refining the coding of the SATURN network.
- 5.2.11 The RSI matrices were combined and the multiple observations of a trip at more than one RSI site were removed by applying the double counting technique at matrix level. All the trips from Zone A to B at different sites were summed up and then divided by the number of sites they appear in.
- 5.2.12 The final RSI matrix totals (in pcu) for each peak are shown in Table 5.3.

**Table 5.3 - RSI matrix totals (pcu)**

USER CLASS ID	USER CLASS DEFINITION	AM PEAK (08:00-09:00)	AVE INTER PEAK (10:00-16:00)	PM PEAK (17:00-18:00)
UC1	Car Employers Business	1,559	1,783	1,078
UC2	Car Commuting	8,738	2,110	6,999
UC3	Car Other	3,481	5,753	8,524
UC4	LGV	2,099	1,950	1,750
UC5	OGV1	801	765	261
UC6	OGV2	255	255	92
<b>Total</b>		<b>16,933</b>	<b>12,616</b>	<b>18,704</b>

### 5.3 INFILL MATRIX

- 5.3.1 To account for car trips that are otherwise unobserved by any of the surveys, the post matrix-estimation matrices assigned in the original CSTM were used to represent the best estimate of unknown movements. This is particularly important for car-based trips, where a large number of trips will occur over short distances on local roads, so would not be captured by the RSI surveys. Other vehicle types will be more strategic in nature, so should be captured by the RSI.

### 5.4 PRIOR MATRIX

- 5.4.1 The final AM peak, PM peak and interpeak infill matrices were assigned to the corresponding SATURN networks. The trips that passed through the 19 RSI sites were identified by means of select link analysis and then replaced with the observed RSI Matrices for each time period thus producing the Prior Matrices.

### 5.5 ASSIGNED MATRIX

- 5.5.1 The final assigned trip matrix was calibrated by undertaking select link analysis at calibration sites and applying scaling factors to adjust the flows, before reinserting the adjusted matrix into the full trip matrix. This provides a targeted adjustment of the matrix that does not distort the observed origin-destination patterns by introducing an excessive volume of short trips - a typical concern when matrix estimation is used, and the reason for the strict controls on its effect set out in WebTAG. Matrix estimation was considered as a final stage of refining the matrix, but this proved unnecessary.

- 5.5.2 Matrix totals for each stage are shown in Table 5.4.

**Table 5.4 - Matrix totals (pcus)**

MATRIX	AM	IP	PM
RSI	16,933	12,616	18,704
Infill	57,889	52,302	60,505
Prior	53,640	48,619	57,125
Assigned	56,377	51,094	57,843

- 5.5.3 In creating the matrices, the best use has been made of the available data. Information from the latest 2014 RSI surveys accounts for approximately 30% of trips. The remainder of trips unobserved by the RSIs has been taken from the existing model matrices, as they are the next best source of information for these trips.

# 6

# CALIBRATION AND VALIDATION RESULT

## 6.1 INTRODUCTION

- 6.1.1 The process of model calibration is designed to ensure that the parameters that control the model's calculation of route choices and the resulting delays lead to accurate replication of traffic patterns in the network. The calibration of a model crucially relies on traffic entering the detailed model area at the correct points and on the correct routes.
- 6.1.2 Validation of the assignment model requires that the modelled transport flows replicate independent data not used at other stages in the construction of the models.
- 6.1.3 A number of calibration and validation checks were carried out including:
- Model convergence
  - Routing Validation
  - Link flow calibration and validation
  - Screenline calibration
  - Journey time validation

## 6.2 MODEL CONVERGENCE

- 6.2.1 Model assignment of trips to the highway network was undertaken using a standard approach based on a 'Wardrop User Equilibrium', which seeks to minimise travel costs for all vehicles in the network. The Wardrop User Equilibrium is based on the following proposition:
- 6.2.2 "Traffic arranges itself on congested networks such that the cost of travel on all routes used between each origin-destination pair is equal to the minimum cost of travel and unused routes have equal or greater costs."
- 6.2.3 The Wardrop User Equilibrium as implemented in SATURN is based on the 'Frank-Wolfe Algorithm', which employs an iterative process. This process is based on successive 'All or Nothing' iterations, which are combined to minimise an 'Objective Function'. The travel costs are recalculated after each iteration and compared to the previous iteration. The process is terminated once successive iteration costs have not changed significantly. This process enables multi-routeing between any origin-destination pair.
- 6.2.4 An element of calibrating the model is ensuring that a satisfactory convergence is achieved. Model convergence is needed to ensure traffic flows remain stable between successive iterations of the model.
- 6.2.5 In accordance with criteria set out in WebTAG Unit M3.1 (January 2014), the parameters %Flow, %GAP and Delta ( $\delta$ ) have been monitored to determine the level of convergence. %Flow measures the proportion of links in the network with flows changing by less than 1% from the previous iteration.  $\delta$  is the difference between costs on chosen routes and costs on minimum cost paths. %GAP is a generalisation of the  $\delta$  function to include the interaction effects within the simulation.
- 6.2.6 The convergence criteria used to assess when a model is considered to have converged is shown in Table 6.1.

**Table 6.1 - Convergence criteria**

MEASURE OF CONVERGENCE	ACCEPTABLE VALUE
'Delta' and %GAP	Less than 0.1% or at least stable with convergence fully documented and all other criteria met
Percentage of links with flow change < 1%	Four consecutive iterations greater than 98%
Percentage of links with cost change < 1%	Four consecutive iterations greater than 98%
Percentage change in total user costs	Four consecutive iterations less than 0.1%

## 6.2.7

WebTAG M3.1 suggests that delta ( $\delta$ ) and %GAP values of less than 0.1% is the most fundamental indicator of model convergence and should be achieved as a minimum. Tables 6.2, 6.3 and 6.4 indicate a satisfactory convergence has been achieved in all peaks periods regarding these parameters. %Flow has also meets the required standard of four successive iterations greater than 98% with a percentage change of less than 1%. Therefore the base year model for all peak time periods meet the required convergence standards.

**Table 6.2 - AM peak convergence results**

ITERATION	DELTA ( $\Delta$ )	%FLOW	%GAP
87	0.0041	98.8	0.011
88	0.0054	98.4	0.004
89	0.0031	99.8	0.012
90	0.003	98.7	0.011
91	0.0029	98.6	0.011
92	0.0027	98.7	0.011

**Table 6.3 - Inter peak convergence results**

ITERATION	DELTA ( $\Delta$ )	%FLOW	%GAP
13	0.0031	98.1	0.0037
14	0.0016	98.4	0.0039
15	0.0016	98.5	0.0033
16	0.0018	99.5	0.0023
17	0.001	99.1	0.002
18	0.0008	99.7	0.0015

**Table 6.4 - PM peak convergence results**

ITERATION	DELTA ( $\Delta$ )	%FLOW	%GAP
35	0.0106	98.4	0.025
36	0.0102	98.4	0.031
37	0.01	99.5	0.021
38	0.0089	98.8	0.021
39	0.009	99.6	0.021
40	0.0095	98.9	0.025

## 6.3 ROUTEING VALIDATION

- 6.3.1 The calibration of a model crucially relies on traffic entering the detailed modelling area at the correct points and on the correct routes. The TREE function in the SATURN programme P1X plots all the routes used within the network for trips between two zones. By using the TREE function for many zone pairs throughout the study area, routes used by traffic were examined to ensure they are reasonable and resemble probable routes used by vehicles in the base traffic situation.
- 6.3.2 Plotted trees display the percentage of traffic using each different route, thus highlighting the most common path taken. To check that the assigned routes in the model were feasible, 'trees' were generated for representative origin-destination pairs. The trees can be seen in Appendix E. These figures used examples of disparate origin-destination pairs and show logical routeing occurs within the model with traffic assigning to major routes appropriately.

## 6.4 LINK FLOW CALIBRATION AND VALIDATION

- 6.4.1 The assignment of the matrix to the network should reproduce the overall level and general distribution of observed traffic, which is assessed by comparing assignment results with selected observed link flows within the study area. The assessment is conducted in accordance with guidance provided in WebTAG.
- 6.4.2 A modified Chi<sup>2</sup> statistic known as the GEH (Geoffrey Edward Havers) statistic was used to determine the best fit. The statistic uses the formula shown below to calculate a value for the difference between observed (O) and modelled (M) flows:

$$\text{GEH} = \sqrt{\frac{(O - M)^2}{0.5(O + M)}}$$

- 6.4.3 The calibration was undertaken for a comprehensive set of traffic count sites for each time period. The calibration counts have been further compared as a whole and as a series of screenlines to further assess current traffic movements. WebTAG recommends counts from ATCs be used in preference to counts from MCCs. Where duplicate counts occur, we have taken the ATC count in preference to the MCC, as a more reliable observation. Arm totals from MCCs have been used to further inform calibration and validation where no other data is available.
- 6.4.4 The criteria used to assess the acceptable performance of a traffic model are defined in WebTAG and are shown in Table 6.5.
- 6.4.5 The GEH statistic takes account of the fact that when traffic flows are low the percentage difference between observed and modelled flows may be high but the significance of this difference is small. A GEH value greater than 10 indicates that closer attention is required as the match between observed and modelled flows is poor, while a GEH of less than 5 indicates a very good fit.
- 6.4.6 It is an important measure of model performance that the model reproduces the observed volumes of traffic. The WebTAG criteria for comparing the performance of the model traffic counts are reproduced in Table 6.5. Modelled flows are expected to be within a certain tolerance of the observed values and this goodness of fit is measured using the GEH statistic. Both the flow comparison and GEH criteria are assessed in this report.

**Table 6.5 - Assignment acceptability guidelines**

CRITERIA AND MEASURE: ASSIGNED MODEL HOURLY FLOWS COMPARED WITH OBSERVED FLOWS		ACCEPTABILITY GUIDELINE
<b>Flow criteria</b>		
Observed flow < 700 vph	Modelled flow within $\pm 100$ vph	> 85 % of links
Observed flow 700 - 2,700 vph	Modelled flow within $\pm 15\%$	> 85 % of links
Observed flow > 2,700 vph	Modelled flow within $\pm 400$ vph	> 85 % of links
Total screenline flows (normally >5 links) to be within $\pm 5\%$		All (or nearly all) screenlines
<b>GEH criteria</b>		
GEH Statistic for individual links < 5		> 85 % of links
GEH Statistic for screenline totals		All (or nearly all) screenlines

- 6.4.7 Appendix F details modelled flow compared to the observed flow for each individual count used during the calibration and validation process. Counts were excluded if they overlapped with or if the data conflicted with adjacent counts. Counts were also excluded if they were located at a minor junction / link not included in the model simulation network.
- 6.4.8 The summary of the link flow calibration and validation results for the final trip matrix in the AM Peak is shown in Table 6.6 and a summary of the distribution of GEH values is provided in Table 6.7.

**Table 6.6 - AM peak calibration and validation results**

CRITERIA AND MEASURE		ACCEPTABILITY GUIDELINE	CALIBRATION			VALIDATION		
<b>Flow criteria</b>								
Observed	Modelled	Requirement	Total	Model	%	Total	Model	%
< 700 vph	$\pm 100$ vph	> 85 % of links	181	155	86%	56	44	79%
700 - 2,700 vph	$\pm 15\%$	> 85 % of links	40	34	85%	16	14	88%
> 2,700 vph	$\pm 400$ vph	> 85 % of links	6	6	100%	0	0	0%
<b>GEH criteria</b>								
GEH Statistic for individual links < 5		> 85 % of links	227	194	85%	72	53	74%
GEH Statistic for screenline totals < 4		All (or nearly all) screenlines	27	30	90%			

- 6.4.9 The AM peak, 27 out of 30 (90%) screenlines have achieved a GEH under 4 and 194 calibration counts (85%) out of 227 counts achieve a GEH under 5. Of the calibration counts with a flow less than 700vph, 155 counts (86%) out of 181 counts meet the criteria. For counts with a flow between 700vph and 2,700vph, 34 counts (85%) out of 40 counts meet the criteria. For calibration counts with a flow over 2,700vph, all counts (100%) meet the required standard.
- 6.4.10 For validation counts with a flow less than 700vph, 44 counts (79%) out of 56 counts meet the criteria which is slightly lower than the 85% threshold. For counts with a flow between 700vph and 2,700vph, 14 counts (88%) out of 16 counts meet the criteria. No counts have a flow greater than 2,700vph in the AM peak.

- 6.4.11 Table 6.7 shows that when calibration and validation links are combined, 83% achieve a GEH under 5 narrowly missing the 85% threshold. However 88% achieve a GEH under six and 97% of these links achieving a GEH under 10. This indicates the model is a good representation of observed counts and therefore existing traffic conditions.

**Table 6.7 - AM peak GEH summary**

GEH RANGE	CALIBRATION	VALIDATION	COMBINED
GEH < 2	43%	42%	43%
GEH < 4	74%	67%	72%
GEH < 6	89%	83%	88%
GEH < 8	96%	90%	95%
GEH < 10	98%	94%	97%
GEH <5	85%	74%	83%

- 6.4.12 The summary of the link flow calibration and validation results in the inter peak is shown in Table 6.8 and a summary of the GEH values for calibration and validation links are provided in Table 6.9.

**Table 6.8 - Inter peak calibration and validation results**

CRITERIA AND MEASURE		ACCEPTABILITY GUIDELINE		CALIBRATION			VALIDATION		
Flow criteria			Total	Model	%	Total	Model	%	
Observed	Modelled	Requirement							
< 700 vph	±100 vph	> 85 % of links	201	177	88%	60	51	85%	
700 - 2,700 vph	±15%	> 85 % of links	20	19	95%	12	10	82%	
> 2,700 vph	±400 vph	> 85 % of links	6	6	100%	0	0	0%	
GEH criteria									
GEH Statistic for individual links < 5		> 85 % of links	227	193	85%	72	54	75%	
GEH Statistic for screenline totals < 4		All (or nearly all) screenlines	27	30	90%				

- 6.4.13 The calibration results for the inter peak period meet the criteria in terms of GEH and flow. Of the 227 counts analysed, 193 (85%) counts have a GEH value under 5. 177 counts (88%) out of 201 counts have a flow of less than 700vph which meet the criteria. 19 counts (95%) out of 20 which have a flow of between 700vph and 2,700vph meet the criteria. For counts with a flow of over 2,700vph there are 6 counts (100%) out of 6 counts that meet the criteria. 27 (90%) of the 30 screenlines achieve an overall GEH below 4.

- 6.4.14 For the validation counts, 51 out of 60 counts (85%) with a flow below 700vph are within the flow difference guidelines. For the counts with flows of between 700vph and 2,700vph, 10 of the 12 counts (82%) meet the required flow criteria. No counts have a flow greater than 2,700vph in the inter peak.

- 6.4.15 Table 6.9 shows that when calibration and validation counts are combined, 83% of counts achieve a GEH under five. However, 86% of counts achieve a GEH under six, and 97% of achieve a GEH under 10.

**Table 6.9 - Inter peak GEH summary**

GEH RANGE	CALIBRATION	VALIDATION	COMBINED
GEH < 2	39%	38%	39%
GEH < 4	77%	68%	75%
GEH < 6	88%	81%	86%
GEH < 8	93%	88%	92%
GEH < 10	96%	97%	97%
GEH <5	85%	76%	83%

- 6.4.16 The summary of the link flow calibration and validation results in the PM peak is shown in Table 6.10 and a summary of the GEH values for calibration and validation links is provided in Table 6.11.
- 6.4.17 In the PM peak, 194 counts (85%) out of 227 counts achieve a GEH under 5. Of the counts with a flow less than 700vph, 151 counts (88%) out of 171 counts meet the required flow criteria. For counts with a flow between 700vph and 2,700vph, 39 counts (78%) out of 50 counts meet the requirements. For the counts with flows over 2,700vph, four of the six counts (75%) meet the criteria.
- 6.4.18 For validation counts with a flow less than 700vph, 43 counts (78%) out of 55 counts meet the criteria which are lower than the 85% threshold. For counts with a flow between 700vph and 2,700vph, 12 counts (71%) out of 17 counts meet the required flow criteria.

**Table 6.10 - PM peak calibration and validation results**

CRITERIA AND MEASURE		ACCEPTABILITY GUIDELINE	CALIBRATION			VALIDATION		
<b>Flow criteria</b>								
Observed	Modelled	Requirement	Total	Model	%	Total	Model	%
< 700 vph	±100 vph	> 85 % of links	171	151	88%	55	43	78%
700 - 2,700 vph	±15%	> 85 % of links	50	39	78%	17	12	71%
> 2,700 vph	±400 vph	> 85 % of links	6	4	67%	0	0	0%
<b>GEH criteria</b>								
GEH Statistic for individual links < 5		> 85 % of links	227	194	85%	72	52	72%
GEH Statistic for screenline totals < 4		All (or nearly all) screenlines	26	30	87%			

- 6.4.19 Table 6.11 shows that when calibration and validation links are combined, 82% achieve a GEH under five. However 87% of all counts achieve a GEH under eight indicating some of these counts are only marginally outside the required level and 95% of these links achieve a GEH under 10.

**Table 6.11 - PM peak GEH summary**

GEH RANGE	CALIBRATION	VALIDATION	COMBINED
GEH < 2	43%	31%	40%
GEH < 4	78%	61%	74%
GEH < 6	87%	72%	83%
GEH < 8	91%	75%	87%
GEH < 10	96%	92%	95%
<b>GEH &lt;5</b>	<b>85%</b>	<b>72%</b>	<b>82%</b>

- 6.4.20 The performance at validation counts is generally lower than that for calibration counts. This is because, by definition, counts at calibration sites have been specifically targeted with matrix and network adjustments to ensure that they correspond to observed flows. Validation counts are an independent check on model performance that have not been specifically targeted. It is therefore to be expected that more calibration sites will pass the criteria than validation sites.

## 6.5 SCREENLINE VALIDATION

- 6.5.1 Tables 6.12 to 6.14 provide a comparison of model flows compared to observed flows across the 30 screenlines. These summary Tables show that in all peaks the majority of screenlines in the model achieve acceptable results in terms of the overall GEH being below four and passes in terms of WebTAG. This shows across the model the major strategic movements of traffic have been accurately captured and are reflected in the final matrix.
- 6.5.2 Appendix F outlines the performance of each count included within each respective screenline.
- 6.5.3 WebTAG Unit M3.1 Table 1 stipulates that modelled flow on screenlines should be within 5% of the observed flow. The screenlines were initially prepared according to WebTAG guidance for potential use in matrix estimation, which recommend a small number of counts. The count coverage is generally such that it is not possible to create larger screenlines that are meaningful. Given the relatively low observed flows across many of the CSTM screenlines the current WebTAG success criteria would be hard to achieve in practice. Therefore screenline validation was reverted to previous WebTAG guidance which requires screenlines to achieve a GEH below four which if achieved is still deemed to be a good match between the observed and modelled flow.
- 6.5.4 Table 6.12 demonstrates that 27 (90%) of the 30 screenlines achieve a GEH below four. This demonstrates in the AM peak the model is replicating the strategic movements of traffic well.
- 6.5.5 The three screenlines which produce a GEH over four include:
- Halifax South Central southbound (screenline 4)
  - Elland West eastbound (screenline 15)
  - Halifax South East northbound (screenline 27)

**Table 6.12 - Highway model screenline validation results – AM peak**

SCREENLINE		AM PEAK

26	Sowerby Bridge SB	1772	1715	1.372	-3%
27	Halifax South East NB	1210	994	6.523	-18%
28	Halifax South East SB	711	674	1.395	-5%
29	Saville Park EB	995	1108	3.497	11%
30	Saville Park WB	592	606	0.573	2%

**6.5.6** Table 6.13 outlines 27 (90%) of the 30 screenlines achieve a GEH under four in the inter peak. This demonstrates the model accurately reflects the balance of strategic traffic movements in the inter peak.

**6.5.7** The three screenlines in the inter peak which show a GEH over four include:

- Halifax South East northbound (screenline 27)
- Halifax South East southbound (screenline 28)
- Saville Park westbound (screenline 30)

**Table 6.13 - Highway model screenline validation results – Inter peak**

SCREENLINE		AM PEAK			
ID	Name	Observed	Modelled	GEH	% Diff
1	Halifax South NB	1597	1531	1.673	-4%
2	Halifax South SB	1671	1571	2.478	-6%
3	Halifax South Central NB	1367	1490	3.253	9%
4	Halifax South Central SB	1328	1417	2.378	7%

15	Elland West EB	484	410	3.508	-15%
16	Elland West WB	430	399	1.494	-7%
17	Elland East WB	815	885	2.377	9%
18	Elland East EB	825	810	0.548	-2%
19	Brighouse South NB	726	733	0.281	1%
20	Brighouse South SB	751	711	1.476	-5%
21	Brighouse East WB	699	762	2.349	9%
22	Brighouse East EB	811	851	1.391	5%
23	Brighouse North SB	970	974	0.126	0%
24	Brighouse North NB	955	945	0.327	-1%
25	Sowerby Bridge NB	1536	1458	2.013	-5%
26	Sowerby Bridge SB	1546	1482	1.643	-4%
27	Halifax South East NB	733	542	7.542	-26%
28	Halifax South East SB	721	575	5.733	-20%
29	Saville Park EB	701	722	0.774	3%
30	Saville Park WB	606	719	4.380	19%

**6.5.8** Table 6.14 shows 26 (87%) of the 30 screenlines achieve a GEH under 4 in the PM peak. This demonstrates the PM peak model replicates strategic traffic movements along key corridors to a satisfactory level of accuracy.

**6.5.9** The four screenlines which show a GEH over four include:

- Halifax North northbound (screenline 10)
- Halifax East eastbound (screenline 14)
- Halifax South East northbound (screenline 27)
- Saville Park eastbound (screenline 29)

**Table 6.14 - Highway model screenline validation results – PM peak**

SCREENLINE		AM PEAK			
ID	Name	Observed	Modelled	GEH	% Diff
1	Halifax South NB	1918	1892	0.609	-1%

26	Sowerby Bridge SB	2070	2005	1.434	-3%
27	Halifax South East NB	756	647	4.095	-14%
28	Halifax South East SB	1091	1005	2.634	-8%
29	Saville Park EB	799	1006	6.909	26%
30	Saville Park WB	827	863	1.238	4%

**6.5.10**

The screenlines which do not meet the criteria are generally caused by a single count within the screenline having a high GEH - other counts within the screenline generally perform well. It is not often possible to achieve a match on 100% of the counts used, and the screenlines adopted indicate areas where groups of counts are robust, and where they are less robust. This does not indicate poor performance of the model, but indicates areas where caution should be used if any specific scheme were to be tested in the vicinity of these counts.

## 6.6 JOURNEY TIME VALIDATION

- 6.6.1 To assist the validation of the highway models journey time data was collected for 38 routes. The observed journey times have been compared against the modelled journey times, graphs comparing the modelled journey time to the observed journey times are included in Appendix G. WebTAG Unit M3.1 paragraph 3.2.10 requires that total modelled journey time should be within 15% (or 1 minute, whichever is greater) of the observed average journey time.
- 6.6.2 Table 6.15 shows that 31 (82%) of the 38 journey time routes are within 15% of the observed journey time in the AM peak. However, it should be noted the following key route is marginally within the required WebTAG criteria:

### **A629 NORTHBOUND (ROUTE 1):**

- 6.6.3 The model represents this route 15% quicker compared to the observed data. The section of the A629 northbound between the A629 / Elland Riorges junction northbound on-slip and A629 / A6025 Halifax Road northbound on-slip leads to the journey time route falling outside of WebTAG guidance, with the model 39% quicker at the end of this section compared to the observed data. The issue highlights a limitation of SATURN in dealing with the delay caused by traffic funnelling from a dual carriageway into a single carriageway and its interaction with queuing from the roundabout upstream. This configuration occurs immediately north of the A629 / A6025 Halifax Road northbound on-slip and south of the Calder Hebble junction and is known locally to generate considerable delays particularly in the AM peak. SATURN does not offer an adequate tool to emulate this delay where funnelling occurs. In the absence of this it is deemed the journey time along route 1 northbound is being replicated as closely as possible.
- 6.6.4 Detailed modelling work will be carried out in this area using Paramics which will be used to develop and test a preferred scheme at the Calder Hebble junction. As a micro-simulation tool, Paramics will be able to more accurately emulate the delay and driver behaviour at this location. The combination of the strategic SATURN model and micro-simulation Paramics model will be able to provide sufficient confidence in the potential impacts of a preferred scheme at the Calder Hebble junction.
- 6.6.5 There is one other notable discrepancy in the AM peak:

### **HALIFAX / SOUTHOWRAM / BRIGHOUSE NORTHBOUND (ROUTE 14)**

- 6.6.6 The cause of the discrepancy on this route is a mismatch between the observed and modelled times at the A644 Wakefield Road / A642 Clifton Road signalised junction. We have checked the signal timings at this junction and ensured they are coded correctly. The resultant modelled journey times are considered realistic, given the signal timings and traffic flows. Additional surveys of turning flows and delays/queue lengths at this junction would therefore be required to better understand this junction in order to verify the calibration.
- 6.6.7 Two journey time routes are only marginally outside of WebTAG criteria:

### **A629 SOUTHBOUND (ROUTE 1):**

- 6.6.8 This journey time on this route northbound is 18% slower in the model compared to the observed data for this route. The journey time along this route is replicated well until the final section between the A629 northern approach to the Ainley Top roundabout and the southbound exit from this junction, the delay from this junction leads to the journey time route falling marginally outside the WebTAG requirements.

### A6107 / B6114 / ROCHDALE ROAD EASTBOUND (ROUTE 10):

- 6.6.9 This journey time on this route northbound is 20% quicker in the model compared to the observed data for this route. Along the majority of this route the journey time route is accurately replicated by the model, the section of the B6114 Saddleworth Road between Elland Bridge and B6112 Stainland Road does not incur the same level of delay in the model as that shown in the observed data. This leads to the journey falling outside of the WebTAG criteria.
- 6.6.10 Taking into consideration the above two routes and relaxing the requirements of the model to match journey time routes to within 20% means 33 (87%) of the 38 routes in the model replicate the observed data well. This is deemed a sufficient indication that the model is representing travel times and delay in the AM peak to a satisfactory degree.
- 6.6.11 The upper and lower confidence interval and the observed mean for each journey time route were calculated from the supplied TrafficMaster data. These values take into account the variability of the repeated observations along the same route. In the AM peak, route 10 – A6107/B6114/Rochdale Road eastbound shows the modelled journey time falls within the upper and lower confidence limits of the mean.

**Table 6.15 - AM peak hour journey time route comparison**

NAME	LOWER CONFIDENCE LIMITS (s)	OBSERVED (s)	UPPER CONFIDENCE LIMITS (s)	MODELED (s)	DIFFERENCE (s)	%	PASS?
Route 1NB - A629	630.18	718.2	806.22	612	106	15%	Yes
Route 1SB - A629	314.44	339.39	364.3	400	-61	-18%	No

Route 19EB - M62	268.13	281.24	294.37	235	46	16%	Yes

6.6.12 Table 6.16 shows that 33 (87%) of the 38 journey times are within the WebTAG requirement of the model being within 15% of the observed travel time in the inter peak. Relaxing this requirement to 20% as has been done in the AM peak shows two further routes; Route 11 - A629/Stainland Road/Blackley Road northbound (16% quicker) and Route 15 - Queens Road/Freeschool Lane northbound fall within these margins. It is therefore considered the model provides a satisfactory reflection of travel times and delay in the inter peak period.

6.6.13 Taking into account the upper and lower confidence interval for the observed mean for each journey time route, route 11 – A629/Stainland Road/Blackley Road northbound shows the modelled journey time falls within the upper and lower confidence limits of the mean.

**Table 6.16 - Inter peak hour journey time route comparison**

Route 19EB - M62	194.49	195.46	196.40	221	-25	-13%	Yes

6.6.14 Table 6.17 demonstrates that 31 (82%) of the 38 journey time routes are within the WebTAG requirement for the modelled journey time to be within 15% of observed journey time. However Route 16A northbound encompassing the A641 and A6025 is 15.1% quicker in the model compared to the observed data, one second outside the lower limit for it to meet the WebTAG criteria, therefore it should be considered well replicated within the model.

6.6.15 Three other routes are only marginally outside the 15% requirement, these include:

#### QUEENSBURY ROAD / FREE SCHOOL LANE SOUTHBOUND (ROUTE 6)

6.6.16 This route is marginally outside the WebTAG criteria, the section between Southowram Bank/Bank Bottom junction and Free School Lane/Saville Park is simulated quicker than the observed data and leads to the overall route being 16% quicker compared to the observed data.

#### A629 SOUTHBOUND (ROUTE 1)

6.6.17 This route is modelled within 15% of the observed data for most of the route until the A629 northern approach to the Ainley Top roundabout through to the A629 Halifax Road southbound. The lower level of delay incurred in the model traversing the Ainley Top roundabout leads to the overall journey time route becoming marginally slower (19%) than the observed journey time.

#### A629 SOUTHBOUND (ROUTE 2)

6.6.18 This route is modelled within 15% of the observed journey data for this route. From the A629 Salterhebble Hill / A646 Dryclough Lane junction to the A629 Huddersfield Road / A6026 the model travel time is faster than the observed journey time route. This leads to the final cumulative journey time total being 19% lower in the model compared to the observed data.

6.6.19 Relaxing the criteria for the journey times in the model to be within 20% of the observed data means 35 (92%) of the 38 journey time routes are well represented in the model. Therefore it is considered that in the PM peak, the model provides a sufficient reflection of the travel time across key strategic routes within the study area.

6.6.20 Taking into account the upper and lower confidence interval for the observed mean for each journey time route, shows the modelled journey time falls within the upper and lower confidence limits of the mean for the following routes:

- Route 2 A629 southbound
- Route 6 Queensbury Road/Free School Lane southbound
- Route 15 Queens Road/Dryclough Lane southbound

**Table 6.17 - PM peak hour journey time route comparison**

## 6.7 CALIBRATION AND VALIDATION CONCLUSIONS

- 6.7.1 The model calibration process was undertaken successfully and shows the model provides a satisfactory representation of the existing traffic situation within the study area across all three peaks.
- 6.7.2 The link flow calibration and validation results for all time periods are at a sufficient standard to provide confidence the model is replicating existing traffic conditions. In all peaks, at least 194 of the 227 calibration counts (85%) have a GEH value under five. In all peaks at least 26 out of 30 (87%) screenlines meet the required criteria in terms of GEH. Journey time routes are also validated to an acceptable level in all peaks when consideration is taken of how certain routes have performed which marginally fall outside the requirement of the model being within 15% of the observed journey time. Validation across screenlines and journey times provides further confirmation that the base year model reasonably represents observed traffic conditions in Calderdale.
- 6.7.3 Figure 6.1, figure 6.2 and figure 6.3 graphically present the performance of the model against the thresholds of the key acceptability criteria, these figures clearly show the model performs to an acceptable level and robustly represents the local traffic conditions.

# 7 CONCLUSION

- 7.1.1 WSP | Parsons Brinckerhoff has been commissioned by Calderdale Metropolitan Borough Council (CMBC) under the Metro Framework to update and extend the existing Calderdale Strategic Transport Model (CSTM) to represent the current 2014 travel patterns and highway network conditions for the AM peak, inter peak and PM peak time periods. This Local Model Validation Report (LMVR) has outlined the modelling process used to produce a fully validated 2014 base year highway transport model.
- 7.1.2 The model development has involved a comprehensive and extensive data collection exercise, including manual and automatic traffic counts, road side interview surveys and journey time surveys. To ensure compliance with modelling guidance the models have been developed in accordance with the Department for Transport (DfT) Web based Transport Analysis Guidance (WebTAG) on <http://www.dft.gov.uk/webtag/>. This provides detailed guidance on appraisal of transport projects and wider advice on scoping and carrying out transport studies.
- 7.1.3 The highway model calibration process was undertaken successfully and has produced a reasonable standard and quality of results for all time periods.
- 7.1.4 The technical information presented in this report demonstrates that the CSTM is adequate representation of base year traffic condition for each time period. It can be concluded that overall the CSTM is considered to be a robust tool and is suitable to be used for traffic forecasting, development and scheme appraisal, and hence is considered to be fit for purpose.
